Optimization name	Explanation	gcc level
High level	*At or near the source level; processor independent*	
Procedure integration	Replace procedure call by procedure body	O3
Local	*Within straight-line code*	
Common subexpression elimination	Replace two instances of the same computation by single copy	O1
Constant propagation	Replace all instances of a variable that is assigned a constant with the constant	O1
Stack height reduction	Rearrange expression tree to minimize resources needed for expression evaluation	O1
Global	*Across a branch*	
Global common subexpression elimination	Same as local, but this version crosses branches	O2
Copy propagation	Replace all instances of a variable A that has been assigned X (i.e., $A = X$) with X	O2
Code motion	Remove code from a loop that computes same value each iteration of the loop	O2
Induction variable elimination	Simplify/eliminate array addressing calculations within loops	O2
Processor dependent	*Depends on processor knowledge*	
Strength reduction	Many examples; replace multiply by a constant with shifts	O1
Pipeline scheduling	Reorder instructions to improve pipeline performance	O1
Branch offset optimization	Choose the shortest branch displacement that reaches target	O1

FIGURE e2.15.7 Major types of optimizations and explanation of each class. The third column shows when these occur at different levels of optimization in gcc. The GNU organization calls the three optimization levels medium (O1), full (O2), and full with integration of small procedures (O3).
